Introduction

The protocol generator creates a BrainVoyager QX Protocol file (*.prt) in milliseconds from a Presentation Log file (*.log). Each Picture or Sound event will result in a single condition.

Latest version of the plugin: 0.8.

Acknowledgements

Thanks to Aline de Borst for providing Presentation *.log and BrainVoyager stimulation protocol (*.prt) files.

Preparation and installation

Preparation for Presentation *.log file before acquiring data

When using the protocolgenerator, it is important to have a regular output. Although in the heading more fields are announced, these values are only for when an event occurs written to the Log file.

For a pulse or response event type, the generator expects 6 columns to appear on each line:

Trial, EventType, Code, Time, TTime, Uncertainty, Duration

or

Subject, Trial, EventType, Code, Time, TTime, Uncertainty, Duration

For all other types (e.g. Pulse or Response), usually less values are written in the Log (see figure below)

Trial	Event Type	Code	Time	TTime	Uncertainty	Duration	Uncertainty	ReqTime	ReqDur
0	Pulse	30	0	0	NA				
1	Pulse	30	10000	9904NA					
1	Pulse	30	20000	19904	NA				
1	Pulse	30	30000	29904	NA				
1	Pulse	30	40000	39904	NA				
1	Pulse	30	50000	49904	NA				
1	Pulse	30	60000	59904	NA				
1	Pulse	30	70000	69904	NA				
1	Pulse	30	80000	79904	NA				
1	Pulse	30	90000	89904	NA				
1	Pulse	30	100000	99904	NA				
1	Pulse	30	110000	109904	NA				
1	Pulse	30	120000	119904	NA				

In the figure below is shown that in the Presentation Log file 10 columns are written for a Picture event, and 6 values for a Pulse and Response. This is the expected format.

17	Pulse	30	3540000	101563	NA				
17	Pulse	30	3550000	111563	NA				
17	Pulse	30	3560000	121563	NA				
17	Pulse	30	3570000	131563	NA				
17	Pulse	30	3580000	141563	NA				
18	Picture	img13588479	0	117	116571	118	0	next	
18	Pulse	30	3590000	1521NA					
18	Pulse	30	3600000	11521	NA				
18	Pulse	30	3610000	21521	NA				
18	Pulse	30	3620000	31521	NA				
18	Pulse	30	3630000	41521	NA				
18	Pulse	30	3640000	51521	NA				
18	Pulse	30	3650000	61521	NA				
18	Pulse	30	3660000	71521	NA				
18	Pulse	30	3670000	81521	NA				
18	Pulse	30	3680000	91521	NA				
18	Pulse	30	3690000	101521	NA				
18	Pulse	30	3700000	111521	NA				
18	Response5	3704975	116496	1					
19	Picture	img23705050	0	1	99374	66	0	next	
19	Pulse	30	3710000	4950NA					
19	Pulse	30	3720000	442652	NA				

Please note that for event types, spaces in the name are not allowed. So for an event with the name `img nr2` please change the name to `imagenr2` (for example via the 'Replace all' function of a text editor).

Installation

Put the `protocolgenerator.dll/*.dylib` in `/(My) documents/BVQXExtensions/Plugins/` folder.

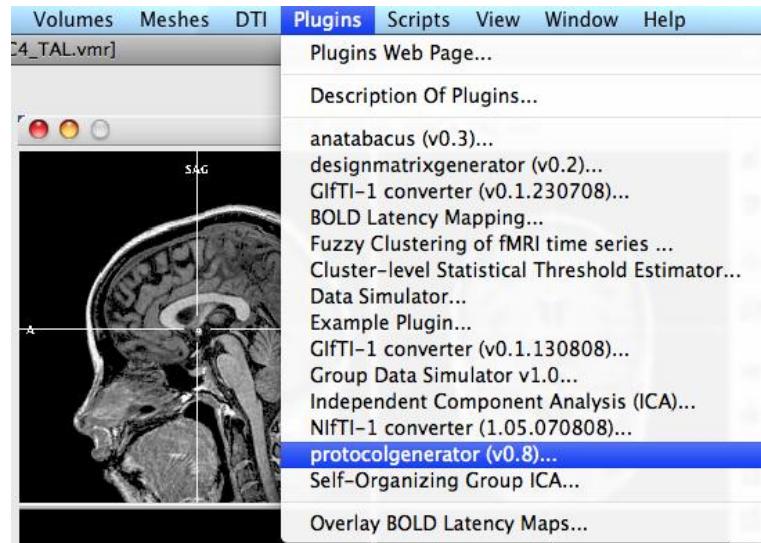

In case you have a operating system than the binaries available, use the source code to compile a version for your own platform (for instructions on compilation, please consult the Appendix).

Using the protocol generator

Open a BrainVoyager VMR project, so that conditions can be assigned to the new protocol. In case the offsets need to be changed, also a stimulation protocol should be linked to the *.vmr.

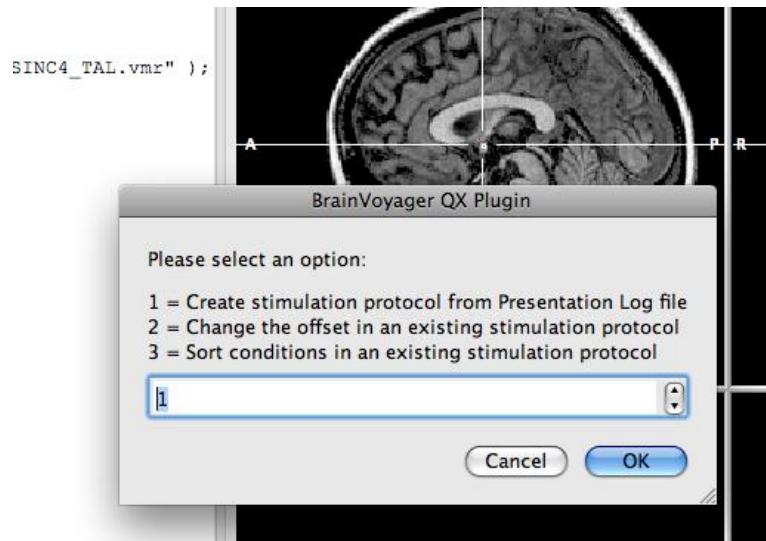

Activating the plugin

Start BrainVoyager QX and activate the protocol generator via the “Plugins” menu:

Main menu

After activating the generator via the Plugins menu, an input dialog shows the options of the protocolgenerator (see figure below).

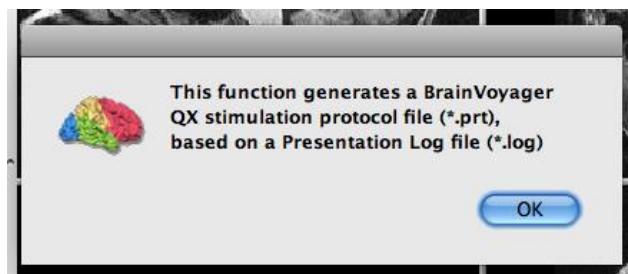

Option 1: generating a protocol file

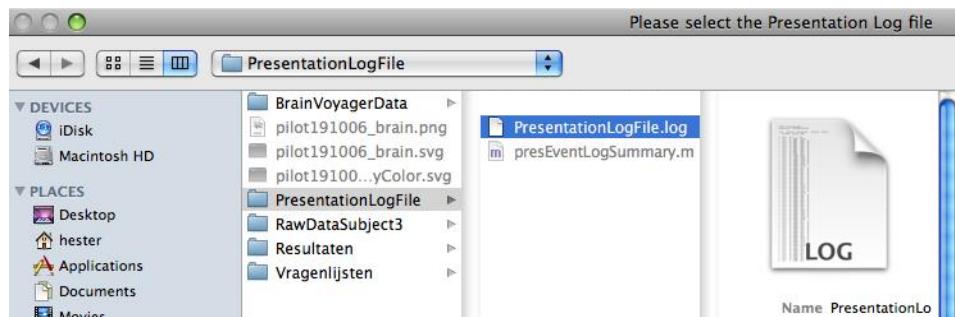

Before starting the plugin, open an anatomical image (*.vmr). It is not necessary to link a *.vtc file in order to use the plugin.

After activating the plugin

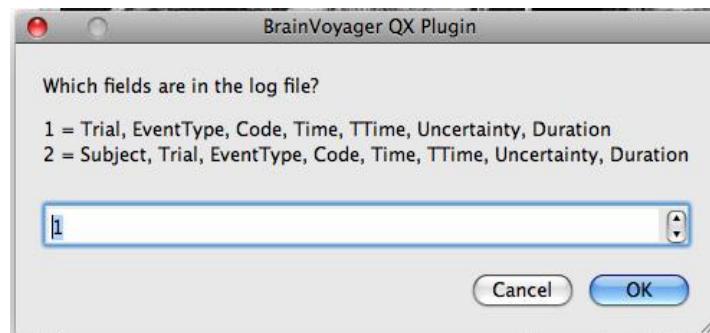

When the plugin is activated and option 1 of the menu has been selected, the following dialog will announce the functionality of menu option 1:

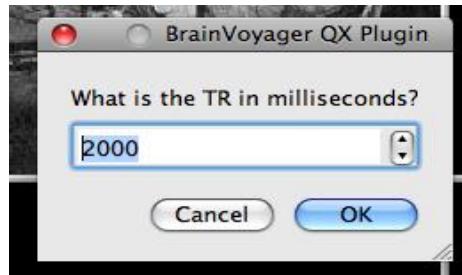

Select the Presentation Log file (*.log):

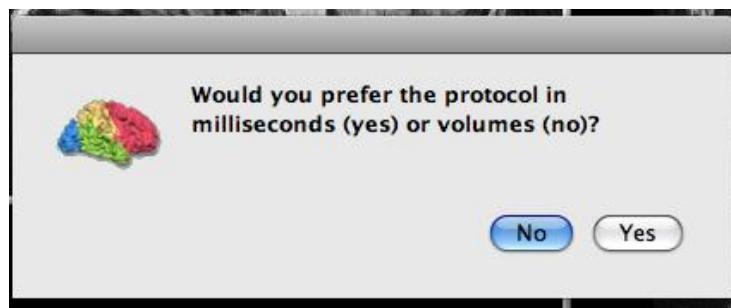

Now, one can choose the columns in the Log file that are (only) written for each event. For more exotic formats, please contact the plugin developer for change requests.

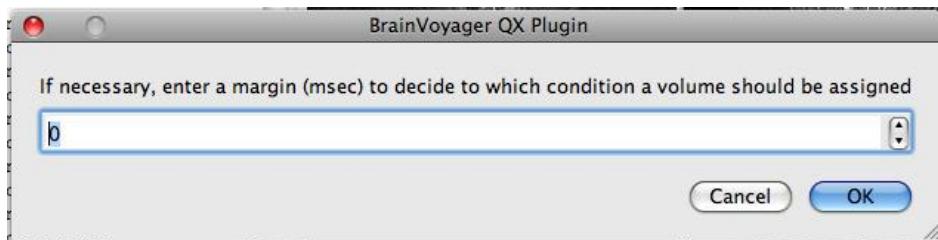

The TR can be entered in the following dialog (is necessary to compute the volume for volume resolution).

Then, the resolution can be chosen, which can be milliseconds or volumes. The volume option is not well tested; it is recommended to select the milliseconds option, because it is always possible in BrainVoyager to change to volumes afterwards.

Thanks to a suggestion of Henk Jansma, it is possible to select a margin that defines to which condition a volume between two conditions should be assigned (in test phase, comments welcome). This dialog only appears when one chooses for volume resolution.

Computation of the interval values in a condition

For millisecond resolution, the interval begin is simply the Ttime in the log file divided by 10. The interval end is the interval begin plus the duration divided by 10.

Begin of an interval

For volumes resolution, the begin is assumed to be:

```

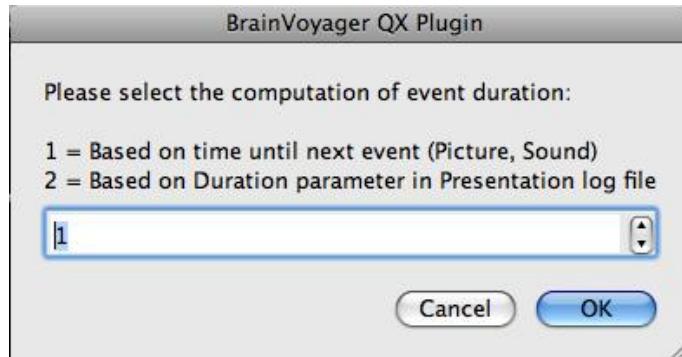

mod = (begin % TR);
if (mod > margin) {
    from = int(ceilf(begin/TR));
} else {
    from = int(floorf(begin/TR));
}

```

End of an interval

The end of an interval can be computed in different ways.

Via the first way, the interval is computed by subtracting the start time of a previous picture from the next picture. Via the second method, simply the Duration parameter in the Presentation log file is used (*.log).

When the end interval is based on the Duration parameter in the Presentation log file (*.log), the duration might not be completely until the next Picture event. For example when a Response event is being logged, the Duration parameter indicates the duration from a Picture until response from a subject. See the figure below for a precise indication of the elements in the *.log file.

method 1: start Picture 2 – start Picture 1

17	Pulse	30	3540000	101563	NA
17	Pulse	30	3550000	111563	NA
17	Pulse	30	3560000	121563	NA
17	Pulse	30	3570000	131563	NA
17	Pulse	30	3580000	141563	NA
18	Picture	img13588479	0	117	116571 118 0 next
18	Pulse	30	3590000	1521NA	
18	Pulse	30	3600000	11521	NA
18	Pulse	30	3610000	21521	NA
18	Pulse	30	3620000	31521	NA
18	Pulse	30	3630000	41521	NA
18	Pulse	30	3640000	51521	NA
18	Pulse	30	3650000	61521	NA
18	Pulse	30	3660000	71521	NA
18	Pulse	30	3670000	81521	NA
18	Pulse	30	3680000	91521	NA
18	Pulse	30	3690000	101521	NA
18	Pulse	30	3700000	111521	NA
18	Responses	3704975	116496	1	
19	Picture	img23705050	0	1	99374 66 0 next
19	Pulse	30	3710000	4950NA	
18	Pulse	30	3700000	41521	NA

method 2: start Picture 1 + duration Picture 1

17	Pulse	30	3540000	101563	NA
17	Pulse	30	3550000	111563	NA
17	Pulse	30	3560000	121563	NA
17	Pulse	30	3570000	131563	NA
17	Pulse	30	3580000	141563	NA
18	Picture	img13588479	0	117	116571 118 0 next
18	Pulse	30	3590000	121NA	
18	Pulse	30	3600000	11521	NA
18	Pulse	30	3610000	21521	NA
18	Pulse	30	3620000	31521	NA
18	Pulse	30	3630000	41521	NA
18	Pulse	30	3640000	51521	NA
18	Pulse	30	3650000	61521	NA
18	Pulse	30	3660000	71521	NA
18	Pulse	30	3670000	81521	NA
18	Pulse	30	3680000	91521	NA
18	Pulse	30	3690000	101521	NA
18	Pulse	30	3700000	111521	NA
18	Responses	3704975	116496	1	
19	Picture	img23705050	0	1	99374 66 0 next
19	Pulse	30	3710000	4950NA	
18	Pulse	30	3700000	41521	NA

When using the 'Duration' parameter, the interval end is computed in the following way:

```
int initialto = start + int(floor((duration/10)));
mod = (initialto % TR);
if (mod > margin) {
    to = int(ceilf(initialto/TR));
} else {
    to = int(floorf(initialto/TR));
}
```

Otherwise the start of the new event is used minus 3 milliseconds, so that the conditions do not overlap.

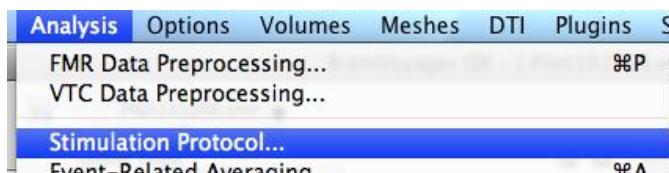

Comments are welcome.

Generating the color values for each condition

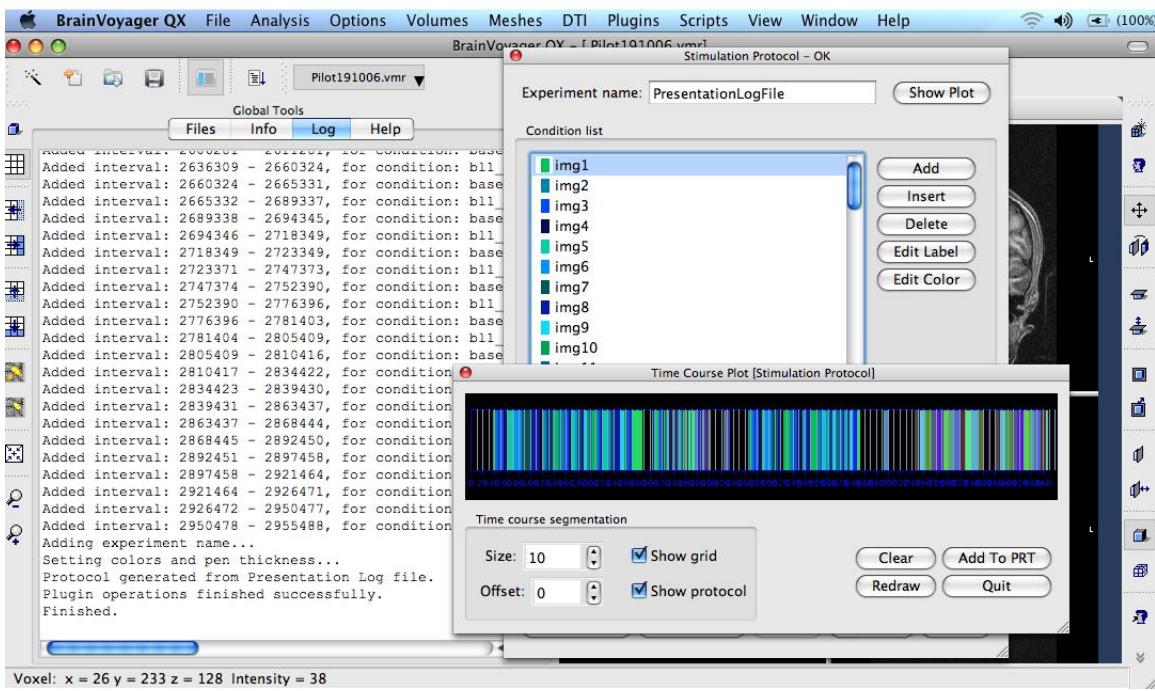

The colors are generated automatically. In future the color generating function might have some randomization feature, so that adjacent conditions can be better distinguished.

Results

The protocol file is written to the same directory as where the Presentation Log file is located. The conversion process is printed to the BrainVoyager QX Log tab.

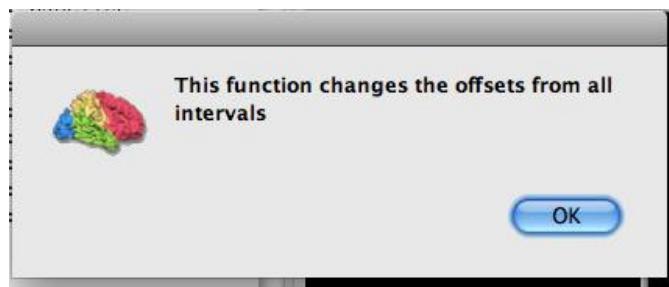

Because the BrainVoyager QX Plugin Access functions are used, the results are directly visible via the "Stimulation Protocol..." option of the BrainVoyager "Analysis" menu.

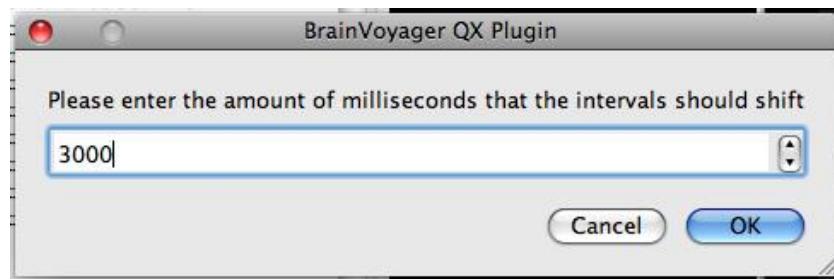

Option 2: changing the offset

When the start of the protocol should be earlier or later, it is possible to change the offset via this function.

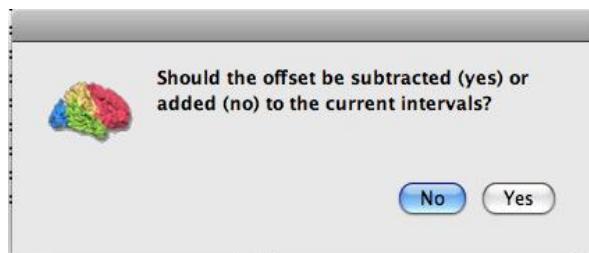

For example, when a few volumes are skipped, one might want to decrease all values by a certain amount. In this case one can subtract this amount via the following procedure. This amount is then subtracted from all interval beginning and endings.

The amount of milliseconds or volumes can be indicated via a dialog (see figure below).

Via the following message box one can indicate whether that amount should be subtracted or added (see figure below).

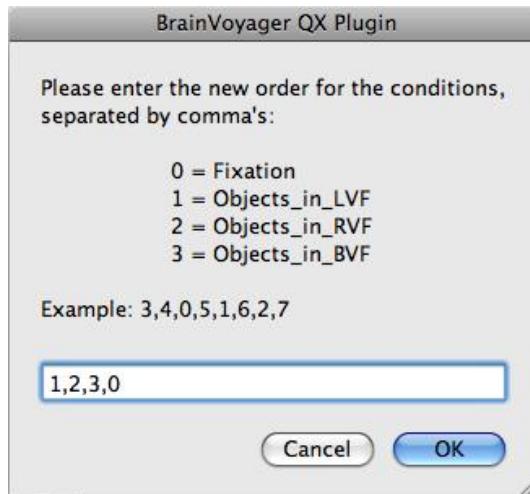

The previous and new interval values are written to the BrainVoyager QX Log tab. The values are changed in the current protocol file.

```
New interval: 2497219 - 2521222
Previous interval: 2897458 - 2921464
New interval: 2900458 - 2924464
Current condition: b11_vr_11_antw_a
Previous interval: 2523244 - 2547246
New interval: 2526244 - 2550246
Previous interval: 2926472 - 2950477
New interval: 2929472 - 2953477
Current condition: b11_vr_12_antw_b
Previous interval: 2552263 - 2576268
New interval: 2555263 - 2579268
Plugin operations finished successfully.
Finished.
```

Option 3: reordering the conditions

When the final goal is to perform a statistical analysis with multiple studies, the order of the conditions needs to be similar in each protocol file, so that the columns (predictors) in the design matrix will correspond in case an automated tool like the designmatrixgenerator plugin is used.

When selecting this option, an input dialog appears which shows the current order of options (see figure above). In the input box one can specify the new order, separated by commas. A stimulation protocol file with the new order of conditions will be saved to disk with the suffix “*_reordered.prt”. A report of the process is printed to the BrainVoyager QX Log tab (see figure below).

```
protocolgenerator> Started...
Condition name: Objects_in_LVF
Number of intervals: 3
New position: 0, previously: 1
Condition name: Objects_in_RVF
Number of intervals: 3
New position: 1, previously: 2
Condition name: Objects_in_BVF
Number of intervals: 3
New position: 2, previously: 3
Condition name: Fixation
Number of intervals: 10
New position: 3, previously: 0
Protocol saved with new name:
/Volumes/LaCie/data/bvqxdata/BVsampleData/BVQXSampleData/CG_OBJECTS2_reordered.prt
Plugin operations finished successfully.
Finished.
```

Stimulation Protocol - OK

Experiment name: Objects

Generating the plugin from source code

Windows XP

For Windows XP, the Visual Studio 2005 project that is included in the source code zip file, can be used to build the protocolgenerator_vxxx.dll.

Mac OS X

For Mac OS X, open the XCode project and click the 'Build' button to generate a protocolgenerator_vxxx.dylib.

Linux

```

Protocol generator

Generating the API documentation

The functions in the header files have been documented using Apple's HeaderDoc markup language. It is possible to generate your own Application Programmer's Interface (API) documentation in the way described below.

Run `headerdoc2html` and `gatherheaderdoc` for the directory where the header files reside:

```
headerdoc2html /Users/hester/Progprojs/C++/2_projects/current/protocolgenerator/api/  
gatherheaderdoc /Users/hester/Progprojs/C++/2_projects/current/protocolgenerator/api/
```

It is also possible to first create a batch file, so that the commands do not need to be retyped each time:

1. add `#!/bin/bash` to an empty text file and add the lines above, save.
2. in the Terminal, type `chmod a+x <name batch file>`
3. to execute the commands in the file, type `./<name batch file>`

For reuse of the batch file, just run (3) in the Terminal (shell).

This will generate the modest Application Programmer's Interface documentation:

The screenshot shows a Mac OS X desktop with a web browser window open. The title bar reads "protocol generator v0.6 api". The address bar shows the URL "file:///Users/hester/Progprojs/C++/2_projects/current/protocolgenerator/api/". Below the browser window, the Dock shows icons for Apple (45), Amazon, eBay, Yahoo!, and News (71).

The API documentation page has a header "protocol generator v0.6 api". Below it, there are two sections:

History

Changes in the plugin

version 0.8

August, 2008: In this version a third option is added, to reorder the conditions. Also, when shifting the protocol timing, the file is now saved with a suffix: “_min/plus<ms>.prt”. Changed text color and time course color to white.

version 0.7

July, 2008: This version of the plugin can compute the end of an interval in two ways.

version 0.6

April, 2008: In this version a function that recognizes intervals of the same condition. The function documentation for generating an API has been changed to Apple's HeaderDoc markup.

Changes in this document

version 0.3

July, 2008: The document has been reorganized, the preparation part moved to the installation section. Also, the different ways to compute the end of an interval in a condition has been described.

version 0.2

March, 2008: The document has been reorganized, the compilation part has moved to the appendix.

version 0.1

November 2006: Creation of document.
